I commented on a post ([link**](#)) you may find helpful.

Thanks again, Steve Bashir, for your comment. I wish more people had the same approach and thinking as yours - not a follower or cult member, but a listener and open-minded to learn and understand the topic. It will not only help me explain things but will encourage my science/chemistry fellows to come forward to explain how much science has been distorted and messed up in medical and pharmaceutical areas. I will happily help anyone interested in learning about the relevant science aspects. I have significant relevant experience in the field.

Just found an old picture of mine (sitting) with my boss in front of a mass spectrometer (taken sometime in 1980); I helped set it up. It is used to determine the structures of

molecules (yes, chemical molecules, which some in medicine deny exist). The technique is considered one of the most authentic and undisputed leaders in establishing chemical structures, testing, and test method assessment and validation. It is a fairly expensive piece of equipment with a price tag in the millions for research purposes. Interestingly, it works on the principle of fragmentation (considered sequencing in virology/biology). It works with extremely small sample sizes, such as the nano to pico grams range. Everything is validated and certified. I have briefly described its use in my book ([link](#)) from my Ph.D. work.

How else can one convince the validity of science to those looking for foundational studies/papers to only mean working with physically visible amounts/atoms/molecules? They do not know science, even at the basic level. Others promote that viruses have been isolated and characterized by sequencing – what a none-sense! They really have no clue about the underlying science (sequencing) and are ruining public health and wealth with their fancy mumbo jumbo.

The public should know the situation and ask for a thorough audit of these so-called science experts (“scientists”) and their claims. The next time you hear the word virus (old or new) and its vaccine (new or old), please read this note and ask questions – most definitely, it would all be based on fake and false science.

Best to you all.

Steve Bashir

Saeed Qureshi Yes, and among those who are speaking out against the official pseudoscience we are getting more pseudoscience, more unscientific claims. To keep people entertained and believing in a religious way, another fiction. It's such a travesty. If it were not for you, I would have dropped this whole issue. You are the only one I see speaking the truth and the actual science. Everyone else is just making up stuff for content purposes to keep their ratings and business-model going. And leading people away from the truth. I do hope people come to understand what you bring to them and the fact that there is no one else doing it. When I say that people are appalled. "How can you say that Dr. Qureshi is the only one speaking the truth or the only one who understands/has the knowledge of and expertise in the science involved!". And they think I am a a staunch devotee of you. Lol. Little do they know me. I follow no one on this earth and believe in no one. Including you and including me. What I follow is the truth.
